Noncommunity Public Water Supply Assessment Report For

CORNER LAKE CAMPGROUND

WSSN: 2015521

Source ID: 1

What is SWAS?	WSSN: 2015521 Source ID: 1
The Source Water Assessment Score (SWAS) is a process that factors geologic and water vell attributes, water chemistry, and the potential contaminant sources for each drinking water ource into a ranking system to determine the relative potential for contamination. Generally, ources with lower scores are considered to be less susceptible to contamination than sources	County: DELTA
	Contact
	Name: USFS H IAWATHA NAT FOREST
with higher scores. However, exceptions do exist. This assessment is required by the Michigan Source Water Assessment Program (SWAP) under the provisions of the 1996	Address: 2727 N LINCOLN
amendments to the Federal Safe Drinking Water Act.	City: ISABELLA State/Zip: MI 49829
Well Log and Location	
A well log is a legal document describing the well location, construction, depth, soil formations	Well Log Available: N
penetrated, and capacity. Drilling contractors have been required to complete a well log and submit it to the owner, local health department, and State since 1967. The lack of information from a well log may increase the SWAS. Wellogic is an electronic database for well log information.	Entered in Wellogic: N Wellogic ID Number:
	Wellogic in Number.
Geologic Sensitivity	Geologic Sensitivity - SWAS(G)
This score represents the degree of natural protection afforded by the materials overlying the water- bearing formation. Lower scores indicate more protection. Points are deducted based on the thickness and type of geologic material that overlies the source of water. Surface contaminants migrate downward at varying rates dependent upon geological material and thickness. CCM stands for Continuous Confining Material (og. clay). CPCM stands for Continuous Particulus Particulus Continuous	CCM Points Deducted: 0
	CPCM Points Deducted: 0
	Total SWAS(G) Points: 30
at varying rates dependent upon geological material and thickness. CCM stands for Continuous Confining Material (eg. clay). CPCM stands for Continuous Partially Confining Material (eg. mix of sand and clay). More points are deducted for a thick clay layer than a thick sand layer or a thinner clay layer.	
Confining Material (eg. clay). CPCM stands for Continuous Partially Confining Material (eg. mix of sand	Total SWAS(G) Points:30Geologic Sensitivity Rating:High
Confining Material (eg. clay). CPCM stands for Continuous Partially Confining Material (eg. mix of sand and clay). More points are deducted for a thick clay layer than a thick sand layer or a thinner clay layer. Point Range 0-30.	Geologic Sensitivity Rating: High

Water Chemistry and Isotope Data	Water Chemistry and Isotope Data - SWAS(C)
Points are added if water sample results indicate detectable levels of nitrates or nitrites, volatile organic chemicals (solvents, fuel components), and/or synthetic organic chemicals (pesticides or herbicides). Tritium monitoring is included as a voluntary	Nitrates and Nitrites: 10
means of age-dating water. Generally, the older the water, the more protected the source. Point Range 0-50. (50 points = MCL violation)	SOC.VOC:5Tritium Results:0
Susceptibility is Very High if contaminants exceed the Maximum Contaminant Level (MCL).	Total SWAS(C) Points: 15
Isolation from Sources of Contamination	Isolation from Contamination - SWAS(S)
Points are added based on the number and type of potential contaminant sources within the isolation distance (75 ft. from standard or 800 ft. from major contaminant sources). Examples of standard sources are septic tanks, sewer lines, and storm drains. Examples of major sources are chemical and fuel storage, landfills, lagoons, and known plumes of groundwater contamination.	Major Sources from 75 - 800 ft: $0 \times 10 = 0$ Major Sources within 75 ft: $0 \times 20 = 0$ Standard Sources within 75 ft: $0 \times 10 = 0$ Known Sources within 800 ft: $0 \times 25 = 0$
	Total SWAS(S) Points: 0
Source Water Assessment Score (SWAS)	Source Water Assessment Score - SWAS
The total SWAS is factored with the Geologic Sensitivity to determine the overall susceptibility to contamination.	30 + 40 + 15 + 0 = 85 SWAS(G) SWAS(W) SWAS(C) SWAS(S) SWAS
Susceptibility Determination	Susceptibility Determination
Susceptibility is a means to identify the relative potential of contamination for public water supply sources.	Based on the above compilation of source geology, well construction, water chemistry, and potential contaminant sources, this public drinking water supply is determined to have a Susceptibility Rating of:
