Noncommunity Public Water Supply Assessment Report For

MARY'S KOUNTRY KORNER

WSSN: <u>2016806</u>

Source ID: 1

What is SWAS?	WSSN: 2016806 Source ID: 1
The Source Water Assessment Score (SWAS) is a process that factors geologic and water well attributes, water chemistry, and the potential contaminant sources for each drinking water source into a ranking system to determine the relative potential for contamination. Generally, sources with lower scores are considered to be less susceptible to contamination than sources	County: ARENAC
	Contact
	Name: MARY CLINE
with higher scores. However, exceptions do exist. This assessment is required by the	Address: 2005 N. MELITA ROAD
Michigan Source Water Assessment Program (SWAP) under the provisions of the 1996	City: STERLING
amendments to the Federal Safe Drinking Water Act.	State/Zip: MI 48659
Well Log and Location	Well Log Available: Y
A well log is a legal document describing the well location, construction, depth, soil formations	Entered in Wellogic: N
penetrated, and capacity. Drilling contractors have been required to complete a well log and submit it to the owner, local health department, and State since 1967. The lack of information from a well log	Wellogic ID Number:
may increase the SWAS. Wellogic is an electronic database for well log information.	
Geologic Sensitivity	Geologic Sensitivity - SWAS(G)
This score represents the degree of natural protection afforded by the materials overlying the water-	Geologic Sensitivity - SWAS(G) CCM Points Deducted: 9
This score represents the degree of natural protection afforded by the materials overlying the water- bearing formation. Lower scores indicate more protection. Points are deducted based on the thickness and type of geologic material that overlies the source of water. Surface contaminants migrate downward	
This score represents the degree of natural protection afforded by the materials overlying the water- bearing formation. Lower scores indicate more protection. Points are deducted based on the thickness and type of geologic material that overlies the source of water. Surface contaminants migrate downward at varying rates dependent upon geological material and thickness. CCM stands for Continuous	CCM Points Deducted: 9 CPCM Points Deducted: 6

Source Water Assessment for: <u>MARY'S KOUNTRY KORNER</u>

Water Chemistry and Isotope Data Points are added if water sample results indicate detectable levels of nitrates or nitrites, volatile organic chemicals (solvents, fuel components), and/or synthetic organic chemicals (pesticides or herbicides). Tritium monitoring is included as a voluntary means of age-dating water. Generally, the older the water, the more protected the source. Point Range 0-50. (50 points = MCL violation) Susceptibility is Very High if contaminants exceed the Maximum Contaminant Level (MCL).	Water Chemistry and Isotope Data - SWAS(C) Nitrates and Nitrites: 0 SOC.VOC: 5 Tritium Results: 0 Total SWAS(C) Points: 5
Isolation from Sources of Contamination Points are added based on the number and type of potential contaminant sources within the isolation distance (75 ft. from standard or 800 ft. from major contaminant sources). Examples of standard sources are septic tanks, sewer lines, and storm drains. Examples of major sources are chemical and fuel storage, landfills, lagoons, and known plumes of groundwater contamination.	Isolation from Contamination - SWAS(S)Major Sources from 75 - 800 ft:1 x 10 = 10Major Sources within 75 ft:0 x 20 = 0Standard Sources within 75 ft:0 x 10 = 0Known Sources within 800 ft:0 x 25 = 0
Source Water Accessment Seere (SMAS)	Total SWAS(S) Points: 10 Source Water Assessment Score - SWAS
Source Water Assessment Score (SWAS) The total SWAS is factored with the Geologic Sensitivity to determine the overall susceptibility to contamination.	$\frac{15}{\text{SWAS}(G)} + \frac{25}{\text{SWAS}(W)} + \frac{5}{\text{SWAS}(C)} + \frac{10}{\text{SWAS}(S)} = \frac{55}{\text{SWAS}(S)}$
Susceptibility Determination Susceptibility is a means to identify the relative potential of contamination for public water supply sources.	Susceptibility Determination Based on the above compilation of source geology, well construction, water chemistry, and potential contaminant sources, this public drinking water supply is determined to have a Susceptibility Rating of: Moderately High
